PREFACE.

This volume of the *American Nautical Almanac* was prepared under the immediate supervision of Professor W. S. EICHELBERGER, U. S. N., the Director, and follows the arrangement of the immediately preceding volumes.

The declination of the Sun, the equation of time, the right ascension and declination of the Moon, and its parallax and semidiameter are given for each even hour throughout the year; the right ascension, declination, and time of transit of Venus, Mars, Jupiter, and Saturn are given for every day of the year. The apparent places of 55 stars and their times of transit at Greenwich are given for the first of each month and the mean places of 110 additional stars follow. There are also given the elements and circumstances of the eclipses and charts of the solar eclipses; a concise statement of predictions of celestial phenomena; a table for finding the latitude by an observed altitude of Polaris; tables for the conversion of sidereal into solar time and *vice versa;* a table to enable one to obtain from the Almanac for 1920 an approximate solar ephemeris for subsequent years; and tables for finding the times of rising and setting of the Sun and Moon.

A full statement of the data from which the various ephemerides are derived will be found in the *American Ephemeris and Nautical Almanac* for 1920.

T. B. HOWARD,
Rear Admiral, U. S. Navy, Retired,
Superintendent Naval Observatory.

WASHINGTON, *January, 1918.*

PREFACE.

CONTENTS.

ANNIVERSARIES AND FESTIVALS, 1920.

New Year's Day	Thursday,	Jan. 1.
Epiphany	Tuesday,	Jan. 6.
Septuagesima Sunday	Sunday,	Feb. 1.
Lincoln's Birthday	Thursday,	Feb. 12.
Quinquagesima (Shrove Sunday)	Sunday,	Feb. 15.
Ash Wednesday	Wednesday,	Feb. 18.
Washington's Birthday	Sunday,	Feb. 22.
Palm Sunday	Sunday,	Mar. 28.
Good Friday	Friday,	Apr. 2.
First Day of Passover	Saturday,	Apr. 3.
Easter Sunday	Sunday,	Apr. 4.
Rogation Sunday	Sunday,	May 9.
Ascension Day	Thursday,	May 13.
Hebrew Pentecost (Shebuoth)	Sunday,	May 23.
Pentecost (Whit Sunday)	Sunday,	May 23.
Trinity Sunday	Sunday,	May 30.
Memorial Day	Sunday,	May 30.
Corpus Christi	Thursday,	June 3.
Independence Day	Sunday,	July 4.
Labor Day	Monday,	Sept. 6.
Hebrew New Year (Rosh Hashanah)	Monday,	Sept. 13.
Day of Atonement (Yom Kippur)	Wednesday,	Sept. 22.
First Day of Tabernacle (Sucoth)	Monday,	Sept. 27.
Columbus Day	Tuesday,	Oct. 12.
General Election Day	Tuesday,	Nov. 2.
Thanksgiving Day	Thursday,	Nov. 25.
First Sunday in Advent	Sunday,	Nov. 28.
Christmas Day	Saturday,	Dec. 25.

CHRONOLOGICAL ERAS AND CYCLES.

CHRONOLOGICAL ERAS.

The year 1920 of the Christian era comprises the latter part of the 144th and the beginning of the 145th year of the independence of the United States of America, and corresponds to the year 6633 of the Julian period.

Of the peoples using the Christian era some employ the Gregorian calendar and some the Julian. January 1, 1920, Julian calendar, corresponds to January 14, 1920, Gregorian calendar.

The year 7429 of the Byzantine era begins on September 1, 1920, Julian calendar.

The year 5681 of the Jewish era begins at sunset on September 12, 1920, Gregorian calendar.

The year 2673 since the foundation of Rome, according to VARRO, begins on January 1, 1920, Julian calendar.

The year 2669 of the era of NABONASSAR begins on April 30, 1920, Julian calendar.

The year 2580 of the Japanese era, being the 9th year of the period Taisho, begins on January 1, 1920, Gregorian calendar.

The year 2232 of the Grecian era, or the era of the SELEUCIDÆ, begins in the present-day usage of the Syrians on September 1, 1920, or on October 1, 1920, Julian calendar, according to different sects; but in the ancient usage of Damascus and Arabia Petræa the year began with the vernal equinox.

The year 1637 of the era of DIOCLETIAN begins on August 29, 1920, Julian calendar.

The year 1339 of the Mohammedan era, or the era of the Hegira, begins at sunset on September 14, 1920, Gregorian calendar.

2 422 325 is the Julian day number of January 1, 1920, Gregorian calendar.

CHRONOLOGICAL CYCLES.

Dominical Letters . . .	DC	Solar Cycle	25
Epact	10	Roman Indiction . . .	3
Lunar Cycle or Golden Number	2	Julian Period	6633

ASTRONOMICAL CONSTANTS.

Solar Parallax	8.80″	Paris Conference.
Constant of Nutation	9.21″	Paris Conference.
Constant of Aberration	20.47″	Paris Conference.
General Precession	$50''.2564+0''.000\,222(t-1900)$	Newcomb.
Obliquity of the Ecliptic	$23^\circ\,27'\,8''.26-0''.4684(t-1900)$	Newcomb.
Equatorial Horizontal Parallax of the Moon	$57'\,2''.63$*	(Newcomb).

Mean distance Earth to Moon 384 411 kilometers=238 862 statute miles or 60.2678 radii.

Mean distance Earth to Sun 149 504 201 kilometers=92 897 416 statute miles.

Velocity of light 299 860 kilometers=186 324 statute miles per second (Newcomb and Michelson).

Light travels unit distance in $498^s.580$.

Gaussian Gravitation Constant, †$k=0.017\,202\,099=3\,548''.187\,61$.

Acceleration in one second due to gravity, $g=9.8060^m-0.0260^m\cos 2\varphi-\frac{2h}{R}g$.‡ Helmert.

Length of seconds pendulum, $l=0.993\,549^m-0.002\,631^m\cos 2\varphi-\frac{2h}{R}l$.‡ Helmert.

Length of the year:

Tropical (ordinary)	$365.242\,198\,79^d-0.000\,000\,0614^d\,(t-1900)$	Newcomb.
Sidereal	$365.256\,360\,42+0.000\,000\,0011\,(t-1900)$	Newcomb.
Anomalistic	$365.259\,641\,34+0.000\,000\,0304\,(t-1900)$	Newcomb.
Eclipse	$346.620\,000+0.000\,000\,36\,(t-1900)$	

Length of the month:

Synodical (ordinary)	$29^d.530\,588-29^d\,12^h\,44^m\,2^s.8$	Hansen.
Tropical	$27.321\,582-27\;\;7\;43\;4.7$	Hansen.
Sidereal	$27.321\,661-27\;\;7\;43\;11.5$	Hansen.
Anomalistic	$27.554\,550-27\;13\;18\;33.1$	Hansen.
Nodical	$27.212\,219-27\;\;5\;\;5\;35.7$	Hansen.

Length of the day:

Sidereal	$23^h\,56^m\,4^s.091$ of mean solar time.
Mean Solar	$24\;\;3\;56.555$ of sidereal time.

Dimensions of the Earth (Hayford's Spheroid of 1909):

Equatorial Radius, $a=6378.388$ kilometers or 3963.34 statute miles.

Polar Radius, $b=6356.909$ " or 3949.99 " "

Flattening, $\frac{a-b}{a}=\frac{1}{297.0}$

Logarithm of the eccentricity $\frac{\sqrt{a^2-b^2}}{a}=\log e=8.913\,804$

Logarithm radius$=\log\rho=9.999\,2695+0.000\,7324\cos 2\varphi-0.000\,0019\cos 4\varphi$.

Reduction from geographic latitude φ to geocentric latitude φ',

$$\varphi'-\varphi=-11'\,35''.66\sin 2\varphi+1''.17\sin 4\varphi.$$

1 degree of latitude (in statute miles)$=69.0569-0.3494\cos 2\varphi+0.0007\cos 4\varphi$.

1 degree of longitude (in statute miles)$=69.2316\cos\varphi-0.0584\cos 3\varphi+0.0001\cos 5\varphi$.

1 meter=3.280 8333 feet. 1 foot=0.304 8006 meters.

1 statute mile=0.868 362 nautical or geographical miles.

1 nautical mile=1.151 594 statute miles.

* Used in the computation of eclipses. The parallax used in the computation of the ephemeris of the Moon contained in this volume is $57'\,2''.23$ (Hansen).

† k^2 is the acceleration due to the Sun's attraction at the mean distance of the Earth from the Sun, which is also the astronomical unit of distance, the unit of time being one mean solar day.

‡ φ=latitude, h=elevation above sea level in meters, and log R=6.80416.

NOTE.—The above values of $\log\rho$ and $\varphi'-\varphi$ were computed with the eccentricity that results from assuming that the flattening of the earth is exactly $\frac{1}{297}$.

The elements of the four inner planets are derived from those given by NEWCOMB in Vol. VI of the *Astronomical Papers of the American Ephemeris*, and are the same as those used in computing the ephemerides of these planets. Those of Jupiter, Saturn, Uranus, and Neptune are taken from Vol. VII of the *Astronomical Papers* for the epoch of the tables. They are reduced to 1920 by applying LE VERRIER'S variations, and can not be regarded as being strictly identical with the elements used in computing the ephemerides of those planets in this volume.

* At mean distance. See *Ast. Papers Am. Eph.*, Vol. IX, p. 39.

† By mean least distance is meant the difference between the mean distance and unity.

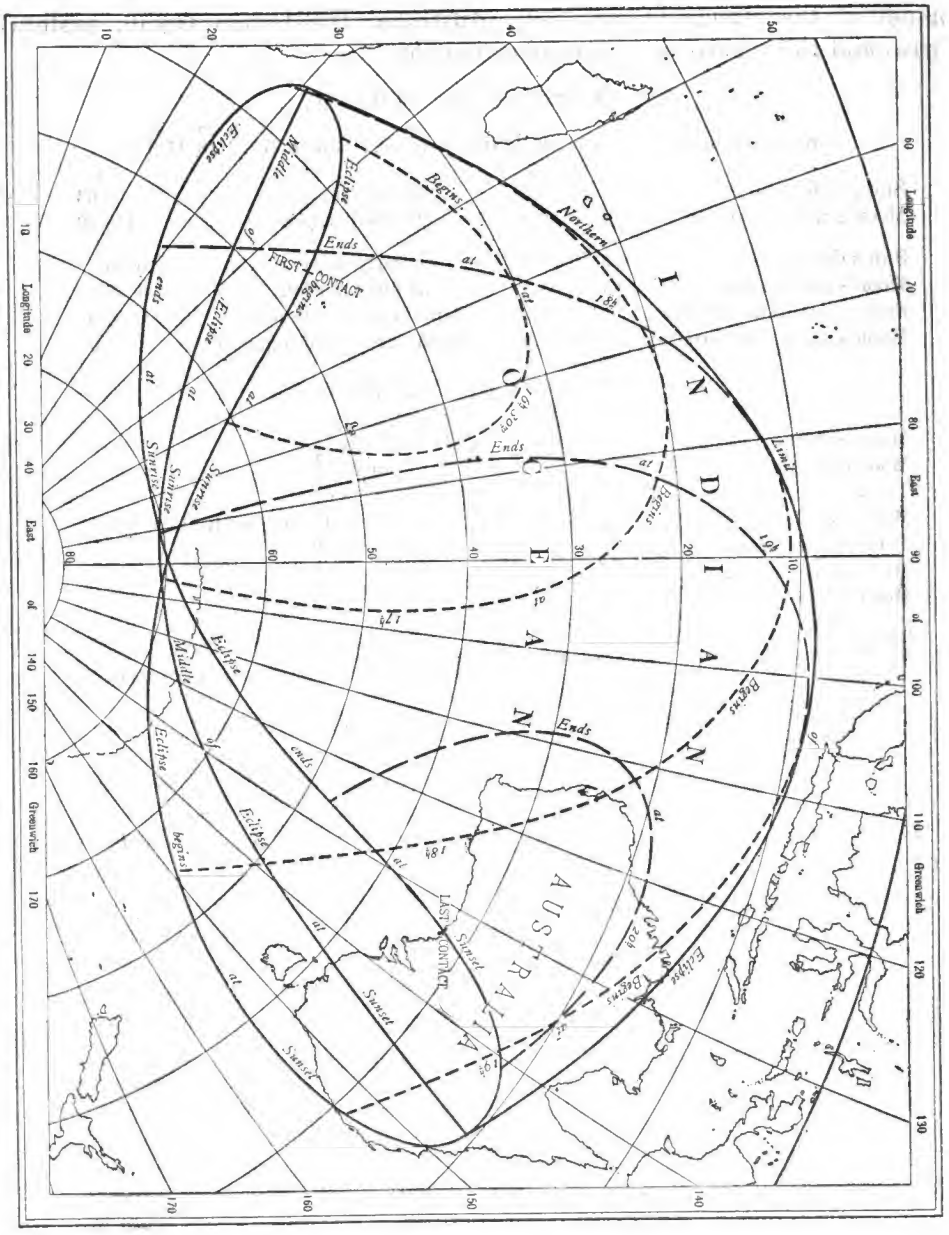
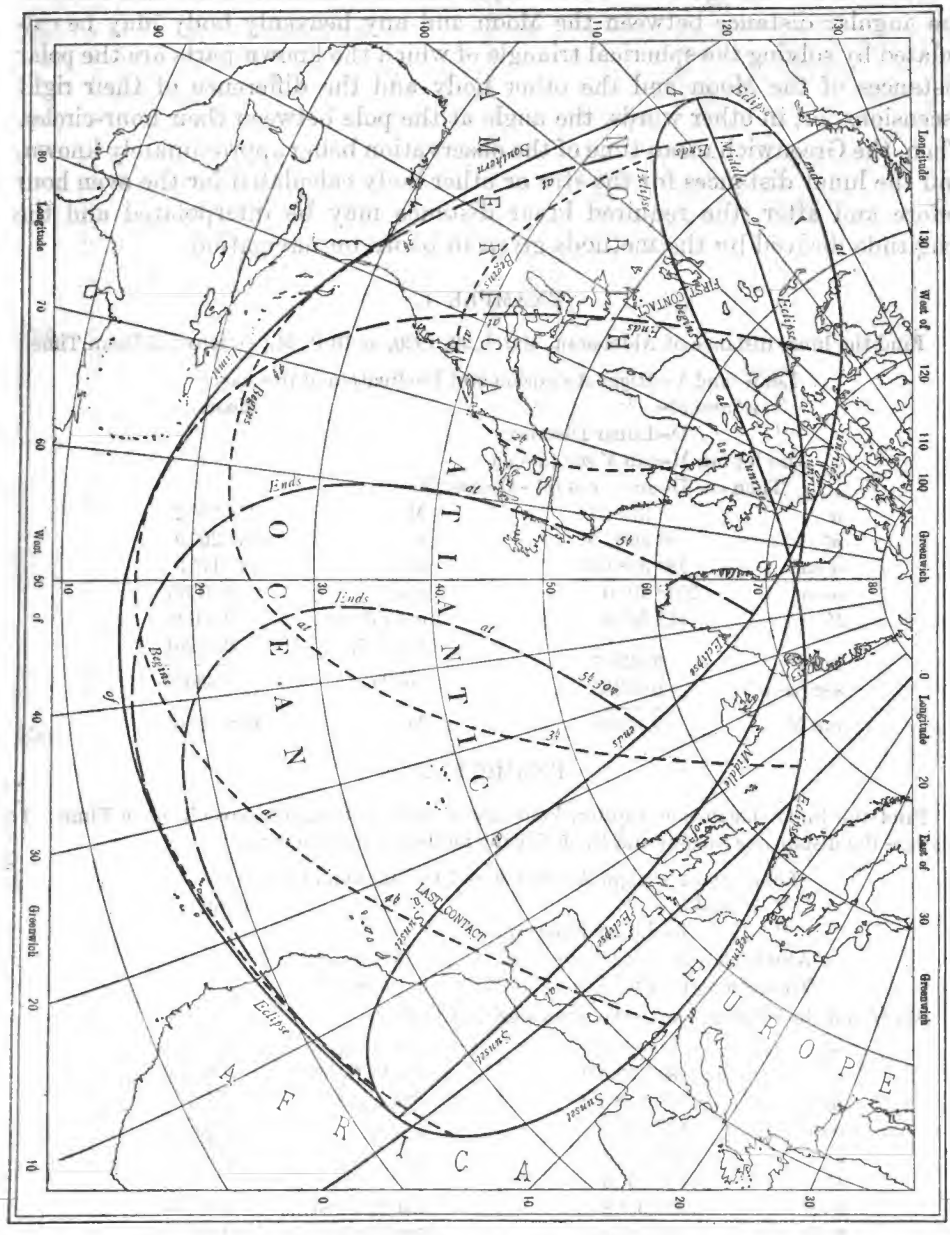
Magnitude of greatest eclipse=0.742 (Sun's diameter=1.0).

PARTIAL ECLIPSE OF MAY 17, 1920.



Note: The hours of beginning and ending are expressed in Greenwich Mean Time.

PARTIAL ECLIPSE OF NOVEMBER 10, 1920.



THE COMPUTATION OF LUNAR DISTANCES.

Tables of lunar distances are no longer given in the Almanac, in accordance with the decision of the Navy Department that they are now of little practical use to navigators. However, in case it is desired to use this method, the angular distance between the Moon and any heavenly body may be calculated by solving the spherical triangle of which the known parts are the polar distances of the Moon and the other body and the difference of their right ascensions, or, in other words, the angle at the pole between their hour-circles. Then, the Greenwich mean time of the observation being approximately known, and the lunar distances for the star or other body calculated for the even hour before and after, the required lunar distance may be interpolated and the longitude derived by the methods given in books on navigation.

EXAMPLE 1.

Find the lunar distance of Aldebaran, March 29, 1920, at 10 P. M., Greenwich Mean Time.

Let α and δ = Right Ascension and Declination of the star
" α' and δ' = " " " " " " Moon
" D = Lunar Distance
Also let tan M = tan δ' sec ($\alpha - \alpha'$)
Then cos D = sin δ' cos (M − δ) cosec M

α	$4^h\ 31^m\ 21^s$	M	27° 38′.2
α'	$8^h\ 56^m\ 5^s$	δ	+16° 20′.9
$\alpha - \alpha'$	$19^h\ 35^m\ 16^s$	M − δ	11° 17′.3
$\alpha - \alpha'$	293° 49′.0	sin δ'	9.31567
δ'	+ 11° 56′.3	cos (M − δ)	9.99151
		cosec M	0.33361
tan δ'	9.32517		
sec ($\alpha - \alpha'$)	0.39382	cos D	9.64079
tan M	9.71899	D	64° 4′.0

EXAMPLE 2.

Find the lunar distance of Jupiter, February 3, 1920, at noon, Greenwich Mean Time. In this case the distance is smaller and the following method is more accurate:

Let α and δ = Right Ascension and Declination of the planet
" α' and δ' = " " " " " " Moon
" D = Lunar Distance
Also let tan N = tan ½ ($\alpha - \alpha'$) cos ½ ($\delta + \delta'$) cosec ½ ($\delta - \delta'$)
Then sin ½ D = sin ½ ($\alpha - \alpha'$) cos ½ ($\delta + \delta'$) cosec N

Sin N and sin ½ ($\alpha - \alpha'$) have the same algebraic sign.

α	$9^h\ 3^m\ 23^s$	tan ½ ($\alpha - \alpha'$)	9.05418
α'	$8^h\ 11^m\ 41^s$	cos ½ ($\delta + \delta'$)	9.98185
$\alpha - \alpha'$	$0^h\ 51^m\ 42^s$	cosec ½ ($\delta - \delta'$)	1.64757
$\alpha - \alpha'$	12° 55′.5	tan N	0.68360
δ	+17° 44′.3	N	78° 17′.6
δ'	+15° 9′.5		
$\delta + \delta'$	+32° 53′.8	sin ½ ($\alpha - \alpha'$)	9.05142
$\delta - \delta'$	+ 2° 34′.8	cos ½ ($\delta + \delta'$)	9.98185
		cosec N	0.00913
½ ($\alpha - \alpha'$)	6° 27′.8	sin ½ D	9.04240
½ ($\delta + \delta'$)	+16° 26′.9	½ D	6° 19′.8
½ ($\delta - \delta'$)	+ 1° 17′.4	D	12° 39′.6

FOR FINDING THE LATITUDE BY AN OBSERVED ALTITUDE OF POLARIS, 1920.

Reduce the observed altitude of Polaris to the true altitude.

Reduce the recorded time of observation to the local sidereal time.

With this sidereal time take out the correction from the table below, and add it to or subtract it from the true altitude, according to its sign. The result is the approximate latitude of the place.

Example.—June 10, 1920, at $10^h\ 40^m\ 30^s$ P. M., mean solar time, in longitude 74° west of Greenwich, suppose the true altitude of Polaris to be 39° 46′; required the latitude of the place.

	h	m	s
Local astronomical mean time	10	40	30
Reduction from page 2, for $10^h\ 40^m\ 30^s$	+ 1	45	
Greenwich sidereal time of mean noon, June 10, page 2	5	14	9
Reduction from page 2, for longitude ($=4^h\ 56^m$ west, or plus)	+ 0	49	
Sum (having regard to signs) is equal to local sidereal time	15	57	13
	°	′

FOR OBTAINING APPROXIMATELY THE SOLAR EPHEMERIS FOR ANY YEAR, 1921–1934, FROM THAT FOR 1920.

Year.	Correction.	Year.	Correction.
	h m		h m
1921	− 5 50	1928	+ 1 19
1922	−11 41	1929	− 4 29
1923	−17 32	1930	−10 16
1924	+ 0 37	1931	−16 3
1925	− 5 13	1932	+ 2 10
1926	−11 3	1933	− 3 36
1927	−16 53	1934	− 9 23

For any instant of time in 1921 to 1934, proceed as follows:

1. Reduce the local mean time to Greenwich mean time.
2. To this G. M. T. apply the correction found opposite to the given year in the above table.
3. If the given month be January or February of a common year (not a leap year), apply a further correction by adding one day.
4. With the time thus corrected, take out from pages 2–29 of this Almanac the several quantities relating to the Sun.

Example.—Find the right Ascension of the Mean Sun, the Equation of Time, the Sun's Declination, and the Sun's Semidiameter for Feb 8, 1921, 1 p. m., local mean time, at a place whose longitude is 45°, or 3^h, west of Greenwich.

	d h m
Local astronomical mean time	Feb. 8 1 0
Longitude from Greenwich	+ 3 0
Greenwich Mean Time	Feb. 8 4 0
Correction for 1921	−0 5 50
Correction for January and February of a common year .	+1 0 0
Corrected time for use with 1920 Almanac	Feb 8 22 10

On pages 2, 3, 8, and 9, for the corected time, the following values are found:

	h m s
Right Ascension of the Mean Sun	21 12 51.3
Equation of Time	−14 20.4
	° ′
Sun's Declination	-15 1.0
	′
Sun's Semidinmeter	16.2

NOTE.—The above method neglects entirely the change in the longitude of the perihelion of the earth's orbit and that in the perturbations by the planets, and therefore should not be used when an Almanac of date can be obtained.

LOCAL ASTRONOMICAL MEAN TIME OF SUNRISE (SUN'S UPPER LIMB), MERIDIAN OF GREENWICH, 1920.

To obtain civil time, subtract 12 hours, mark the result A. M., and add one to the day.

To obtain the standard time at any station, increase the local time by the number of minutes the station is west of the standard meridian, or decrease the local time by the number of minutes the station is east of the standard meridian.

For sunrise in southern latitudes see page 132.

LOCAL ASTRONOMICAL MEAN TIME OF SUNSET (SUN'S UPPER LIMB), MERIDIAN OF GREENWICH, 1920.

To obtain civil time, write P. M. after the astronomical time.

To obtain the standard time at any station, increase the local time by the number of minutes the station is west of the standard meridian, or decrease the local time by the number of minutes the station is east of the standard meridian.

For sunset in southern latitudes see page 132.

LOCAL ASTRONOMICAL MEAN TIME OF SUNRISE (SUN'S UPPER LIMB), MERIDIAN OF GREENWICH, 1920.

To obtain civil time, subtract 12 hours, mark the result A. M., and add one to the day.

To obtain the standard time at any station, increase the local time by the number of minutes the station is west of the standard meridian, or decrease the local time by the number of minutes the station is east of the standard meridian.

For sunrise in southern latitudes see page 132.

LOCAL ASTRONOMICAL MEAN TIME OF SUNSET (SUN'S UPPER LIMB), MERIDIAN OF GREENWICH, 1920.

To obtain civil time, write P. M. after the astronomical time.

To obtain the standard time at any station, increase the local time by the number of minutes the station is west of the standard meridian, or decrease the local time by the number of minutes the station is east of the standard meridian.

For sunset in southern latitudes see page 132.

LOCAL ASTRONOMICAL MEAN TIME OF SUNRISE (SUN'S UPPER LIMB), MERIDIAN OF GREENWICH, 1920.

To obtain civil time, subtract 12 hours, mark the result A. M., and add one to the day.

To obtain the standard time at any station, increase the local time by the number of minutes the station is west of the standard meridian, or decrease the local time by the number of minutes the station is east of the standard meridian.

For sunrise in southern latitudes see page 132.

LOCAL ASTRONOMICAL MEAN TIME OF SUNSET (SUN'S UPPER LIMB), MERIDIAN OF GREENWICH, 1920.

To obtain civil time, write P. M. after the astronomical time.

To obtain the standard time at any station, increase the local time by the number of minutes the station is west of the standard meridian, or decrease the local time by the number of minutes the station is east of the standard meridian.

For sunset in southern latitudes see page 132.

LOCAL ASTRONOMICAL MEAN TIME OF SUNRISE (SUN'S UPPER LIMB), MERIDIAN OF GREENWICH, 1920.

To obtain civil time, subtract 12 hours, mark the result A. M., and add one to the day.

To obtain the standard time at any station, increase the local time by the number of minutes the station is west of the standard meridian, or decrease the local time by the number of minutes the station is east of the standard meridian.

For sunrise in southern latitudes see page 132.

LOCAL ASTRONOMICAL MEAN TIME OF SUNSET (SUN'S UPPER LIMB), MERIDIAN OF GREENWICH, 1920.

To obtain civil time, write P. M. after the astronomical time.

To obtain the standard time at any station, increase the local time by the number of minutes the station is west of the standard meridian, or decrease the local time by the number of minutes the station is east of the standard meridian.

For sunset in southern latitudes see page 132.

TABLE VI.

LOCAL ASTRONOMICAL MEAN TIME OF SUNRISE (SUN'S UPPER LIMB), MERIDIAN OF GREENWICH, 1920.

To obtain civil time, subtract 12 hours, mark the result A. M., and add one to the day.

To obtain the standard time at any station, increase the local time by the number of minutes the station is west of the standard meridian, or decrease the local time by the number of minutes the station is east of the standard meridian.

For sunrise in southern latitudes see page 132.

LOCAL ASTRONOMICAL MEAN TIME OF SUNSET (SUN'S UPPER LIMB), MERIDIAN OF GREENWICH, 1920.

To obtain civil time, write P. M. after the astronomical time.

To obtain the standard time at any station, increase the local time by the number of minutes the station is west of the standard meridian, or decrease the local time by the number of minutes the station is east of the standard meridian.

For sunset in southern latitudes see page 132.

LOCAL ASTRONOMICAL MEAN TIME OF SUNRISE (SUN'S UPPER LIMB), MERIDIAN OF GREENWICH, 1920.

To obtain civil time, subtract 12 hours, mark the result A. M., and add one to the day.

To obtain the standard time at any station, increase the local time by the number of minutes the station is west of the standard meridian, or decrease the local time by the number of minutes the station is east of the standard meridian.

For sunrise in southern latitudes see page 132.

LOCAL ASTRONOMICAL MEAN TIME OF SUNSET (SUN'S UPPER LIMB), MERIDIAN OF GREENWICH, 1920.

To obtain civil time, write P. M. after the astronomical time.

To obtain the standard time at any station, increase the local time by the number of minutes the station is west of the standard meridian, or decrease the local time by the number of minutes the station is east of the standard meridian.

For sunset in southern latitudes see page 132.

LOCAL ASTRONOMICAL MEAN TIME OF SUNRISE (SUN'S UPPER LIMB), MERIDIAN OF GREENWICH, 1920.

To obtain civil time, subtract 12 hours, mark the result A. M., and add one to the day.

To obtain the standard time at any station, increase the local time by the number of minutes the station is west of the standard meridian, or decrease the local time by the number of minutes the station is east of the standard meridian.

For sunrise in southern latitudes see page 132.

LOCAL ASTRONOMICAL MEAN TIME OF SUNSET (SUN'S UPPER LIMB), MERIDIAN OF GREENWICH, 1920.

To obtain civil time, write P. M. after the astronomical time.

To obtain the standard time at any station, increase the local time by the number of minutes the station is west of the standard meridian, or decrease the local time by the number of minutes the station is east of the standard meridian.

For sunset in southern latitudes see page 132.

LOCAL ASTRONOMICAL MEAN TIME OF SUNRISE (SUN'S UPPER LIMB), MERIDIAN OF GREENWICH, 1920.

To obtain civil time, subtract 12 hours, mark the result A. M., and add one to the day.

To obtain the standard time at any station, increase the local time by the number of minutes the station is west of the standard meridian, or decrease the local time by the number of minutes the station is east of the standard meridian.

For sunrise in southern latitudes see page 132.

LOCAL ASTRONOMICAL MEAN TIME OF SUNSET (SUN'S UPPER LIMB), MERIDIAN OF GREENWICH, 1920.

To obtain civil time, write P. M. after the astronomical time.

To obtain the standard time at any station, increase the local time by the number of minutes the station is west of the standard meridian, or decrease the local time by the number of minutes the station is east of the standard meridian.

For sunset in southern latitudes see page 132.

SUNRISE AND SUNSET FOR SOUTHERN LATITUDES, 1920.

In the case of a southern latitude the time of sunrise or sunset is taken from Table VI, with the corresponding northern latitude, not for the given date but for a date about six months earlier or later, which is to be found in the following table. The time taken from Table VI, whether of sunrise or of sunset, must be corrected by the quantity given in Table VII on the same line with the given date.

Example.—May 10, 1920, civil date, in latitude −38°, required the time of sunrise and sunset.

The astronomical date is May 9 for sunrise and May 10 for sunset; Table VII gives November 11 and 12 as the corresponding dates, northern latitude, while the correction is +12^m in each case.

LOCAL ASTRONOMICAL MEAN TIME OF MOONRISE (MOON'S UPPER LIMB), MERIDIAN OF GREENWICH, 1920.

To obtain civil time, write P. M. after the astronomical time if it is less than twelve hours; if greater than twelve hours, subtract twelve hours from it, mark the result A. M., and add one to the day.

To obtain standard time, see directions on page 116.

For other longitudes and for southern latitudes see page 150.

LOCAL ASTRONOMICAL MEAN TIME OF MOONSET (MOON'S UPPER LIMB), MERIDIAN OF GREENWICH, 1920.

To obtain civil time, write P. M. after the astronomical time if it is less than twelve hours; if greater than twelve hours, subtract twelve hours from it, mark the result A. M., and add one to the day.

To obtain standard time, see directions on page 116.

For other longitudes and for southern latitudes see page 150.

LOCAL ASTRONOMICAL MEAN TIME OF MOONSET (MOON'S UPPER LIMB), MERIDIAN OF GREENWICH, 1920.

To obtain civil time, write P. M. after the astronomical time if it is less than twelve hours; if greater than twelve hours, subtract twelve hours from it, mark the result A. M., and add one to the day.

To obtain standard time, see directions on page 116.

For other longitudes and for southern latitudes see page 150.

LOCAL ASTRONOMICAL MEAN TIME OF MOONSET (MOON'S UPPER LIMB), MERIDIAN OF GREENWICH, 1920.

To obtain civil time, write P. M. after the astronomical time if it is less than twelve hours; if greater than twelve hours, subtract twelve hours from it, mark the result A. M., and add one to the day.

To obtain standard time, see directions on page 116.

For other longitudes and for southern latitudes see page 150.

LOCAL ASTRONOMICAL MEAN TIME OF MOONRISE (MOON'S UPPER LIMB), MERIDIAN OF GREENWICH, 1920.

To obtain civil time, write P. M. after the astronomical time if it is less than twelve hours; if greater than twelve hours, subtract twelve hours from it, mark the result A. M., and add one to the day.

To obtain standard time, see directions on page 116.

For other longitudes and for southern latitudes see page 150.

LOCAL ASTRONOMICAL MEAN TIME OF MOONRISE (MOON'S UPPER LIMB), MERIDIAN OF GREENWICH, 1920.

To obtain civil time, write P. M. after the astronomical time if it is less than twelve hours; if greater than twelve hours, subtract twelve hours from it, mark the result A. M., and add one to the day.

To obtain standard time, see directions on page 116.

For other longitudes and for southern latitudes see page 150.

LOCAL ASTRONOMICAL MEAN TIME OF MOONRISE (MOON'S UPPER LIMB), MERIDIAN OF GREENWICH, 1920.

To obtain civil time, write P. M. after the astronomical time if it is less than twelve hours; if greater than twelve hours, subtract twelve hours from it, mark the result A. M., and add one to the day.

To obtain standard time, see directions on page 116.

For other longitudes and for southern latitudes see page 150.

LOCAL ASTRONOMICAL MEAN TIME OF MOONRISE (MOON'S UPPER LIMB), MERIDIAN OF GREENWICH, 1920.

To obtain civil time, write P. M. after the astronomical time if it is less than twelve hours; if greater than twelve hours, subtract twelve hours from it, mark the result A. M., and add one to the day.

To obtain standard time, see directions on page 116.

For other longitudes and for southern latitudes see page 150.

FOR NORTHERN STATIONS NOT ON THE MERIDIAN OF GREENWICH, AND FOR SOUTHERN STATIONS.

For northern stations not on the meridian of Greenwich.—For longitudes twelve hours or less west from Greenwich obtain the data for the given latitude from Table VIII for the given date and for the date following; for longitudes twelve hours or less east from Greenwich obtain the data for the given latitude from Table VIII for the given date and for the date preceding. Subtract the time on the earlier date from the time on the later and multiply the difference by the twenty-fourth part of the longitude in hours and decimals of an hour, positive if west, negative if east. Apply the product as a correction to the time on the given date.

For southern stations.—The instant of moonrise or moonset for any station south of the equator is that of moonset or moonrise, respectively, at a place of the same latitude north of the equator whose longitude is twelve hours different from that at the southern station.

If the southern station be twelve hours or less west from Greenwich, and the phenomenon at that station occurs between noon and midnight, the local astronomical day will be the same at the southern and northern stations. If, however, the phenomenon at the southern station occurs between midnight and noon, the local astronomical day at the northern station will be one day later than at the southern.

If the southern station be twelve hours or less east from Greenwich, and the phenomenon at that station occurs between noon and midnight, the local astronomical day at the northern station will be one less than at the southern station. If, however, the phenomenon occurs between midnight and noon, the local astronomical day will be the same at the two stations.

Having thus determined the true astronomical day at the northern station, compute by the rule for northern latitudes. For the desired local time of moonrise at the southern station change the time of moonset at the northern station twelve hours. For the desired local time of moonset at the southern station change the time of moonrise at the northern station twelve hours.

Example.—December 20, 1920, civil date, find the time of moonrise and moonset in longitude $4^h\ 43^m$ west from Greenwich and in latitude 33° 30′ south.

The longitude of the northern station is $7^h.3$ east from Greenwich and its latitude is 33°.5 N. Upon inspection of Table VIII it is seen that the astronomical day at the southern station is December 20 for moonrise and December 19 for moonset, the former phenomenon occurring between noon and midnight, the latter between midnight and noon. For the northern station, in accordance with the precepts given above, both phenomena are to be computed for December 20.

At northern station—

	Moonrise. d h m	Moonset. d h m
Table VIII, Lat. +33°.5	Dec. 19 0 21	Dec. 19 13 19
Table VIII, Lat. +33°.5	20 0 57	20 14 20
Difference	36	61
Product of Diff. by $-\frac{7.3}{24}$	−11	−19
Local astronomical mean time	0 46	14 1

At southern station—

	Moonset.	Moonrise.
Local astronomical mean time	12 46	2 1
Civil time	Dec. 20 12 46 A.M.	Dec. 20 2 1 P.M.

ON THE ARRANGEMENT AND USE OF THE AMERICAN NAUTICAL ALMANAC.

There are in general use three different kinds of time, True Solar Time—also called Apparent Solar Time—Mean Solar Time, and Sidereal Time.

True or Apparent Solar Time is measured by the diurnal motion of the Sun, the length of the day being the interval between two successive transits of the Sun over the same meridian, and the time of day being the hour-angle of the Sun westward from the meridian. Owing to the obliquity of the ecliptic and to the lack of uniformity of the motion of the Earth in its orbit, the rate of motion of the Sun in hour-angle and the length of the apparent solar day are not constant. Therefore clocks and chronometers can not be regulated to apparent solar time, which may, however, be determined by observations of the Sun when visible.

Mean Solar Time is measured by the motion of a fictitious body called the mean Sun, which is supposed to move uniformly in the celestial equator, completing the circuit in one tropical year. Since mean solar time is uniform and regular in its passage, clocks and watches may be regulated to it, and those in ordinary use are usually so regulated.

Mean solar time can not, of course, be determined by direct observation, but may be determined indirectly by correcting observations of the Sun for the equation of time, or by converting to mean time sidereal time determined by observations of fixed stars.

The Equation of Time is the difference in hour-angle between the true Sun and the mean Sun. The true Sun is sometimes before and sometimes behind the mean Sun by an amount which varies from zero to about 16 minutes. The equation of time is given for every even hour of Greenwich mean time on pages 6–29.

The Mean Solar Day is the unit of mean solar time, and is equal in length to the mean or average of all the true or apparent solar days of the year. It may be otherwise defined as the interval of time elapsing between two successive transits of the mean Sun across the meridian of any place.

Sidereal Time or star time, in general terms, is measured by the diurnal motion of the fixed stars, or, speaking more precisely, by the diurnal motion of that point on the celestial equator called the vernal equinox, from which the right ascensions of the heavenly bodies are measured. Astronomical clocks regulated to sidereal time are called sidereal clocks. Sidereal time may be determined from observations of stars whose right ascensions are known.

A Sidereal Day is very nearly the length of time in which the Earth rotates on its axis and is accurately defined as the time interval between two successive transits of the vernal equinox over the same meridian. The sidereal

day is shorter than the mean solar day by $3^m\ 56^s.555$ sidereal time or $3^m\ 55^s.909$ mean solar time, the tropical year of 365.2422 mean solar days containing 366.2422 sidereal days. Sidereal time and the length of the sidereal day are subject to slight irregularities on account of small differences between the positions of the true and mean equinoxes.

The mean solar and sidereal days are each divided into 24 hours. About March 23 (civil date) of each year, about two days after the vernal equinox, there is an instant when the face of a sidereal clock shows the same time as a mean time clock, and the former gains on the latter $3^m\ 56^s.555$ sidereal time per mean solar day, so that at the end of a year it will have gained one sidereal day and will again agree with the mean time clock.

The Civil Day begins at midnight and comprises 24 hours, the hours being counted from 0 to 12 in two series; the first, marked A. M., running from midnight to noon, and the second, marked P. M., running from noon to midnight.

The Astronomical Day begins at noon on the civil day of the same date, the 24 hours being counted from 0 to 24, running from noon of one day to noon of the next following day. Astronomical time as well as civil time may be either apparent or mean.

The civil day begins twelve hours before the astronomical day; therefore the first half of the civil day coincides with the last half of the preceding astronomical day, and the last half of the civil day coincides with the first half of the astronomical day of the same date. Hence we have the following rules:

To Convert Civil Time into Astronomical Time.—If the civil time is marked A. M., take one from the day and add twelve to the hours; if the civil time is marked P. M., take away the designation P. M. Thus, January 9, 2 o'clock, A. M., civil time, is January 8, 14^h, astronomical time; and January 9, 2 o'clock, P. M., civil time, is January 9, 2^h, astronomical time.

To Convert Astronomical Time into Civil Time.—If the astronomical time is less than twelve hours, write P. M. after it; if greater than twelve hours, subtract twelve hours from it, mark the result A. M., and add one to the day.

To convert Solar or Sidereal Time of any meridian B to that of another meridian A, add the difference of longitude expressed in time when A is east of B, and subtract the difference of longitude when A is west of B.

Greenwich mean time, which at any fixed observatory is obtained by applying the longitude to the local mean time, on board ship is usually taken from the mean time chronometer set to Greenwich time.

Greenwich mean noon of any date means the noon at the beginning of the astronomical day.

THE EPHEMERIS FOR THE MERIDIAN OF GREENWICH.

Pages 2–3 contain for every day throughout the year the *Right Ascension of the Mean Sun at Greenwich Mean Noon*, which is likewise the sidereal time of mean noon at Greenwich. The table at the foot of pages 2–3 contains the correction to be added to the right ascension of the mean Sun in order to reduce it to any Greenwich mean time other than noon. The correction is tabulated for every six minutes and can be interpolated to any time required. This reduction may also be made by using Table III, pages 110–111 of this volume, for reducing intervals of mean time to sidereal time.

The right ascension of the mean Sun is useful in converting mean solar time at any place into sidereal time. We first convert the given time from civil to astronomical and from local to Greenwich mean time; then from pages 2–3 take out the right ascension of the mean Sun for that time, and this being added to the local astronomical mean time, i. e., the hour angle of the mean Sun, will give the hour angle of the vernal equinox, or the sidereal time required.

The right ascension of the mean Sun may also be used in converting sidereal time at any place into mean solar time. Find the Greenwich mean time of local mean noon, and from pages 2–3 take out for that time the right ascension of the mean Sun, which is the sidereal time of local mean noon. Subtract this from the given sidereal time and convert the interval of sidereal time thus found into mean time by means of Table II, pages 108–109, or by means of the table, *Correction for Longitude* at foot of pages 4–5. If the sidereal interval is less than $3^m\ 56^s.555$, there are two mean times corresponding to the given sidereal time, one a few minutes after the preceding noon, and the other a few minutes before the following noon, the mean time interval between these two mean times being $23^h\ 56^m\ 4^s.09$. The mean time, approximately known, will always show which one is to be taken.

The Sun's right ascension, that is, the right ascension of the true Sun, may be found by applying to the right ascension of the mean Sun from pages 2–3, the equation of time from pages 6–29, but applying it with the sign changed from that given on those pages.

Pages 4–5 contain, for every day throughout the year, the *Mean Time of Sidereal Noon at Greenwich*. The table at foot of pages 4–5 contains the correction to be applied to the mean time of sidereal noon in order to reduce it to any other meridian than that of Greenwich, this correction being additive for east and subtractive for west longitudes. This table may be used also to correct for any Greenwich sidereal time other than noon, the correction in this case being subtractive, and giving, when applied to the mean time of sidereal noon, a result which is 24^h – Right Ascension of the Mean Sun. The mean time of sidereal noon may be conveniently used for converting sidereal to mean time, or—which is the same problem—for finding the time of meridian passage of a star whose right ascension is known, by adding to the mean time of the *preceding* local sidereal noon, the mean time equivalent of the given sidereal time.

Pages 6–29 contain for every even hour throughout the year the *Sun's Declination* and the *Equation of Time;* interpolation may be made by inspection and is facilitated by the *H. D.* (*Hourly Difference*) which is given at the end of each day. At the end of the month is given the Sun's *Semidiameter* for every tenth day. The Sun's declination is required whenever that body is observed for the purpose of finding latitude, local time, or azimuth. The equation of time is the apparent time of Greenwich mean noon, or the hour-angle of the true Sun at that instant. When interpolated to any given Greenwich mean time, it is the correction to be applied to mean time in order to obtain apparent time. The Sun's semidiameter is used in reducing the altitude of the upper or lower limb of the Sun to the altitude of the center; and in reducing the angular distance between the limb of the Sun and any other object to the distance from the center of the Sun.

The Sun's right ascension and declination, as given by the Almanac, are referred to the true equator and equinox; are corrected for aberration, and are, therefore, apparent positions.

It is to be noted that here, as elsewhere throughout the volume, the positive sign used with declinations indicates north and the negative sign south.

As examples of the use of pages 2–29:—

1. Let the sidereal time be required for July 13, 1920, $10^h\ 3^m\ 30^s$, A. M., mean time, at a place whose longitude is 85° 15′, or $5^h\ 41^m$ west from Greenwich.

		h m s
Local astronomical mean time	July	12 22 3 30
Longitude from Greenwich (additive)		5 41 0
Greenwich mean time	July	13 3 44 30
		h m s
R. A. M. S. at G. M. N., July 13, page 3		7 24 15.3
Reduction for $3^h\ 44^m\ 30^s$, bottom of page 2, or Table III		+0 36.9
Add the local astronomical mean time		22 3 30.0
The required sidereal time (rejecting 24^h)		5 28 22.2

2. On July 13, 1920, A. M., at a place whose longitude is 85° 15′ W., suppose the sidereal time to be $5^h\ 28^m\ 22^s.2$, and that the corresponding mean time is required.

The astronomical day is July 12; the longitude in time, $+5^h\ 41^m\ 0^s$.

First solution.

	h m s
R. A. M. S. at G. M. N., July 12, page 3	7 20 18.7
Reduction for $5^h\ 41^m\ 0^s$, bottom of page 2, or Table III	+0 56.0
R. A. M. S. at local mean noon, July 12	7 21 14.7
The given sidereal time ($+24^h$, if necessary for the following subtraction)	29 28 22.2
Subtracting the first from the second gives the sidereal interval from noon	22 7 7.5
Reduction for $22^h\ 7^m\ 7^s.5$, bottom of page 5, or Table II	−3 37.4
The required astronomical mean time	22 3 30.1

Second solution.

		h m s
Mean time at Greenwich sidereal noon, page 5	July 12,	16 36 57.5
Reduction for longitude, bottom of page 4, or Table II		−0 55.9
Mean time of *preceding* local sidereal noon	July 12,	16 36 1.6
Add the given sidereal time		5 28 22.2
Reduction for $5^h\ 28^m\ 22^s.2$, bottom of page 4, or Table II		−0 53.8
The required astronomical mean time	July 12,	22 3 30.0

If there is any doubt about the mean time of the *preceding* local sidereal noon, the first solution is to be preferred.

3. Let the Sun's right ascension and declination be required for July 13, 1920, $10^h\ 3^m\ 30^s$ A. M., mean time, at a place whose longitude is 85° 15′, or $5^h\ 41^m$ west from Greenwich.

		h m s	h
Local astronomical mean time	July 12,	22 3 30	
Longitude from Greenwich (additive)		5 41 0	
Greenwich mean time	July 13,	3 44 30	−3.74

	Equation of Time.	*Sun's Declination.*
	m s	° ′
July 13, 2ʰ, G. M. T.	−5 30.5	+21 50.0
Change in 1ʰ.74	−0ˢ.3×1.74 −0.5	−0′.4×1.74 −0.7
	−5 31.0	+21 49.3

Sun's Right Ascension.	h m s
July 13, R. A. M. S. at G. M. N.	7 24 15.3
Correction for 3ʰ 44ᵐ 30ˢ	+0 36.9
Eq. of Time (sign changed)	+5 31.0
	7 30 23.2

The sign + must be used with the H. D. when the equation of time or Sun's declination, if itself positive, is increasing, or if negative, is decreasing numerically; contrariwise, the sign − must be used with the H. D. when the equation of time or Sun's declination, if positive, is decreasing, or if negative, is increasing numerically.

Pages 30–75 contain for every even hour throughout the year the *Moon's Right Ascension* and *Declination*, referred to the true equator and equinox, and also the *Moon's Semidiameter* and *Horizontal Parallax*. The right ascension and declination are accompanied by the difference or change in every two-hour interval; by means of these differences, interpolation may be conveniently made to any Greenwich mean time by Table IV, *Proportional Parts*, pages 112–114, using the difference in two hours as the argument at the top of the page, and the interval from the nearest even hour of Greenwich mean time as the argument at the left-hand side of the page. The semidiameter and horizontal parallax may be taken directly from the Almanac without interpolation; they are required for all observations of the Moon.

Page 75 contains also the *Phases of the Moon* for the entire year; these are likewise to be found, as they occur, at the foot of pages 30–74.

Example.—Let the Moon's right ascension and declination be required for January 25, 1920, 11ʰ 10ᵐ, astronomical mean time at Greenwich.

The nearest even hour is 12; the interval is 50ᵐ; the difference or increase of right ascension in 2ʰ is 250; the difference of declination in 2ʰ is 231 and is northward, or positive. From Table IV with the arguments 50ᵐ and 250 take out the change in right ascension; and with the arguments 50ᵐ and 231 take out the change in declination. Subtract the changes, since the interpolation is here made backward.

	Right Ascension.	*Declination.*
	h m s	° ′
January 25, 12ʰ 0ᵐ	23 58 49	+ 4 6.1
Change in 50ᵐ	1 44	+ 0 9.6
January 25, 11ʰ 10ᵐ	23 57 5	+ 3 56.5

Pages 76–77 contain the Moon's mean *Time of Transit, Meridian of Greenwich*, accompanied by the difference in minutes between the times of day of successive transits. The local time of the Moon's meridian passage at any given place may be found from that at Greenwich by means of these differences, together with the longitude of the place measured from Greenwich and expressed in time, and Table IV, *Proportional Parts*, pages 112–114, using the differences between the times of successive Greenwich transits as argument

at the top of the page, and the longitude of the given place from Greenwich as the argument at the right-hand side of the page, the rule being to interpolate forward for west longitudes and backward for east longitudes.

Pages 78–93 contain the *Apparent Right Ascension* and the *Apparent Declination* of the four planets, Venus, Mars, Jupiter, and Saturn, for every Greenwich mean noon throughout the year, referred to the true equator and equinox, and the time of *Transit, Meridian of Greenwich*, given to the nearest minute. The apparent right ascensions and the apparent declinations are accompanied by the difference or change in every 24-hour interval. By means of these differences interpolations may be conveniently made to any Greenwich mean time by Table IV, using the difference as the argument at the top of the page and the Greenwich mean time as the argument at the right-hand side of the page. The time of transit meridian of Greenwich can be interpolated by simple inspection to any other meridian, by interpolating forward for west longitudes and backward for east longitudes. The *Semidiameter* and *Horizontal Parallax* of the planets are given at the foot of the pages, for the first day of each month.

The right ascension and declination of a planet are required whenever it is observed for time, latitude, or azimuth. The positions given in the Almanac are the geocentric coordinates of the center of the planet. The semidiameter and horizontal parallax, when appreciable, are required to reduce an observation from the planet's limb to the planet's center, and from the position of the observer to the center of the Earth.

Page 94 contains the *Right Ascension*, and page 95 the *Declination*, in a list of *Apparent Places* of 55 stars. The positions are given for the time of meridian passage at Greenwich on the first day of every month. On page 95 are found also the star's historical or *Special Name* and its *Magnitude*.

Page 96 contains for the same 55 stars the *Greenwich Mean Time of Transit at Greenwich* on the first day of every month. Page 97 contains the correction for reducing the data of page 96 from the first to any other day of the month.

Pages 98–99 contain the *Mean Places*, with their *Annual Variations*, of 110 *Additional Stars* for the beginning of the year 1920.

The right ascension of a star is also the sidereal time of its meridian passage. The mean time of meridian passage may, therefore, be roughly found from the right ascension by adding the mean time of sidereal noon at Greenwich from pages 4–5, or more accurately by the precept already given for the conversion of sidereal time.

The right ascension and declination of a star are required whenever it is observed for time, latitude, or azimuth.

Pages 100–103 contain the principal elements of the solar and lunar eclipses which occur during the year, together with maps of the regions in which the solar eclipses are visible.

The times and angles designated as the circumstances of a lunar eclipse remain the same throughout all parts of the Earth, and require no explanation beyond a mere statement of the fact that in computing them the geometrical diameter of the Earth's shadow has been augmented in the proportion of 51:50.

The principal circumstances of each total and annular eclipse of the Sun are stated in five lines, as follows:—

The line entitled "Eclipse begins" gives the Greenwich mean time at which the Moon's penumbra first touches the Earth, together with the latitude and longitude of the point of contact.

The line entitled "Central eclipse begins" gives the time when the axis of the Moon's shadow first touches the Earth, and the latitude and longitude of the point of contact follow.

The line entitled "Central eclipse at local apparent noon" gives the time when the axes of the Earth and of the shadow cone lie in the same plane. The latitude and longitude of the point where the axis of the shadow cone then cuts the Earth's surface follow, and there the eclipse will be central and the Sun will be exactly on the meridian.

The lines entitled "Central eclipse ends" and "Eclipse ends" give, respectively, the times when and the localities where these events occur, the phenomena being the converse of those denoted by the similar phrases for the beginning.

In the case of partial solar eclipses the axis of the Moon's shadow does not come into contact with the Earth, and the three lines entitled, respectively, "Central eclipse begins," "Central eclipse at local apparent noon," and "Central eclipse ends," are replaced by a single line entitled "Greatest eclipse," whereon are given the time when and the latitude and longitude where the eclipse attains its greatest magnitude. The latter phenomenon necessarily occurs with the Sun in the horizon.

Maps of the Eclipses.—The regions in which each eclipse is visible are shown upon the map relating to it, from which may be taken approximately, for any place, both the times of the beginning and ending of the eclipse and its magnitude. The dotted curves show the outline of the shadow for each hour of Greenwich mean time, and therefore pass through all places where the eclipse begins or ends at the hour indicated. To find the instant of beginning at any place, we determine by inspection between what pair of these curved lines the place is situated. The eclipse will then begin between the corresponding hours of Greenwich mean time; and the fraction of the hour may be determined by dividing the hour in the same proportion as the space representing it on the map is divided by the place in question. This division may be made a little more exact by allowing for the changes in the spaces as indicated by their varying width. The Greenwich mean time thus found must be reduced to local mean time by applying the longitude.

As an example, suppose we wish to find the times at which the eclipse of November 10, 1920, begins and ends at Richmond, Va., whose latitude is $+37° 22'$ and whose longitude is $+77° 26'$.

For the beginning we compare the distance of the place from the curves of 2^h and 3^h and find it to correspond to about 4 minutes from the former, thus giving for the approximate time of beginning $2^h 4^m$; for the end we compare the distance of the place from the curves of 4^h and 5^h and find it to correspond to about 6 minutes from the former, thus giving for the approximate time of ending, $4^h 6^m$; and both of these results are probably correct to within 3 or 4 minutes.

Changing to local mean time, we shall have—

		Beginning. d h m	Ending. d h m
Greenwich mean time	November	10 2 4	10 4 6
Longitude west		5 10	5 10
Local mean time	November	9 20 54	9 22 56

In the case of total and annular eclipses, a fair estimate of the magnitude of the eclipse at any place may be obtained from the position thereof relative to the central line and to the limit. On the central line the eclipse is annular or total, while between the central line and the limit the maximum magnitude of the eclipse is given by the quotient of the distance of the place from the limit divided by the distance of the central line from the limit, the measurements being made upon a line drawn through the place perpendicularly to the central line.

Accurate computations of the times of the phases of solar eclipses for any place may be made by the use of formulæ given in the *American Ephemeris and Nautical Almanac* for 1920, pages 759 to 762.

Page 104 contains two examples of the computation of lunar distances which are inserted because lunar distance tables are no longer published.

Pages 105–106 contain the *Phenomena*, or the configurations of the Sun, Moon, and planets, expressed in the symbols of page x. The predicted times of the conjunctions, quadratures, and oppositions of the planets with respect to the Sun are, respectively, the instants when the longitude of each planet differs from that of the Sun by 0°, ±90°, or 180°. For the conjunction of the planets with the Moon and with each other, the predicted times are the instants when the two bodies have the same right ascension. In the case of conjunction the degrees and minutes to the right indicate the difference of declination. Thus, ☌ ♂ ☾ . . . . ♂ −4° 22′ would be read "Conjunction of Mars with the Moon, Mars 4° 22′ to the South."

Pages 107–150 contain a series of tables numbered from I to VIII.

Table I—*For Finding the Latitude by an Observed Altitude of Polaris.*

Table II—For converting *Sidereal into Mean Solar Time.*

Table III—For converting *Mean Solar into Sidereal Time.*

Table IV—*Proportional Parts*, for use in interpolating positions of the Moon and planets.

Table V—*For Obtaining Approximately the Solar Ephemeris for Any Year 1921–1934 from that for 1920.*

Table VI—For finding the time of *Sunrise* and *Sunset* at any place between the equator and 60° north latitude.

Table VII—*Sunrise and Sunset for Southern Latitudes.*

Table VIII—For finding the time of *Moonrise* and *Moonset.*

GENERAL INDEX.
